

Summary of findings.

During my findings, I found that during the higher temperatures, the more sporadic the notes would be, changing time signatures every bar or 2. With lower temperatures, I felt like there was less creativity within the writing. I did my extra credit on a newer genre of music that mixes rnb type melodies with a plugin sound for producing. The plugin sounds recreate the sound of an instrument being played. With the generation of the new genre, the lower temperatures only made long drawn out notes, but with a higher temperature, it brought out more complex melodies.

Reflection on the model's ability to generate music in the style of Bach (subjective evaluation). I think the model did good for trying to recreate Bach's music, but with Bach's music and my extra credit, a way to use different chords and chord progressions would really help deepen the model's understanding of the music it is generating.
